Patent Claims

1. A method for determining or checking material
characteristic data of a component (2) consisting of
5 fiber reinforced material, in particular of fiber
reinforced plastic, having the following steps:
- a) providing the component (2) consisting of fiber
reinforced material;
- 10 b) determining statically negligibly stressed or
irrelevant regions of the component (2);
- c) removing at least one test piece (12) from the
component (2) at at least one of the statically
negligible or irrelevant regions of the component
15 (2); and
- d) testing the removed test piece (2) with regard to
its technical material properties.
2. The method as claimed in claim 1, characterized in
20 that after the method step d) the component (2) is
provided for further use without the test piece (12).
3. The method as claimed in claim 1 or 2,
characterized in that the test piece (12) is tested in
25 a manner destroying it during the method step d).
4. The method as claimed in at least one of the
preceding claims, characterized in that a cutout (14)
which arises in the component (2) by the removal of the
30 test piece (12) is closed by a filler after the method
step c) or d).
